

P1PER is **AbbVie's global network of leading clinical trial centers in oncology, designed to accelerate early development of novel therapies across difficult-to-treat blood cancers and solid tumors.** P1PER was created to further advance and accelerate cancer research and foster groundbreaking collaboration and innovation.

Through scientific **collaborations with physicians, researchers, and study coordinators** across the network, P1PER is **designed to address key unmet needs for cancer patients** on a global scale and discover new medicines for patients.

The P1PER Approach

What enables our team to develop novel therapies for patients faster

1

Early Engagement: P1PER is dedicated to advancing R&D in oncology, and one way we do that is by engaging with physicians in early stages of oncology drug development to seek insights and feedback into our development plans. P1PER is a unique pharma-study site network in the industry dedicated to early development in oncology.

2

Scientific Collaboration: The P1PER network is comprised of top-tier academic institutions and community cancer centers and physicians working alongside AbbVie scientists to foster breakthrough scientific collaborations. The network allows AbbVie to investigate novel oncology agents, leveraging state-of-the-art translational and clinical research capabilities, to deliver early high-quality data and share scientific insights with the broader oncology community.

3

Strong Global Network: P1PER's geographic diversity provides an opportunity for eligible patients to access investigational medicines earlier through clinical trials across the globe. The network is also backed by an efficient operational model that leverages AbbVie's high standards across R&D and addresses both patient and site staff needs by reducing administrative burden and accelerating the availability of clinical trials.

Our study sites

Currently, P1PER has 29 study sites collaborating across 9 countries.
